

POCKETSMART AI

Performance Testing

- Test startup time and navigation across primary screens.
- Measure dashboard responsiveness with a small and larger transaction dataset.
- Test AI request latency, timeout behavior, and provider/API failure handling.
- Verify forms reject missing, malformed, or invalid values.
- Check layout at desktop and mobile viewport sizes, if responsive UI is supported.
- Record environment, test data, expected result, actual result, and pass/fail evidence. Do not report unmeasured performance figures.
